

Provocation statement: Derek Briggs

University of Colorado Boulder · AIME-Con 2026

Claim

Peer review in our field should use AI twice: reviewers audit a journal-supplied AI review before finalizing theirs, and editors get an AI check of whether the reviews cohere.

In the 14 journals I checked that publish scholarship related to educational measurement and psychometrics, policies block this mainly to protect confidentiality, which a secure, journal-run tool can satisfy.

Example

In a randomized trial at ICLR 2025, 27% of reviewers revised after seeing AI feedback; a panel judged two-thirds of the revisions better.

Unresolved problem

When a reviewer or editor revises their decision or recommendation after reading the AI's critique, whose judgment is it?

No journal policy in our field addresses that case.
